# Overview

- 1 Introduction
- 2 Dependent Type Theory
  - Basic terminologies and structural rules
  - Type constructors
- 3 Basic Constructions
  - Homotopy between functions
  - Equivalence
  - h-level
- 4 Additional Rules in HoTT
  - Function extensionality
  - Univalence axiom
  - Higher inductive types
    - Homotopy pushout
    - Suspension, spheres, and the circle
- 5 The Fundamental Group of The Circle
- 6 Conclusion

- HoTT는 유형론의 framework 를 가지는 새로운 형식 체계
- 그 자체로 호모토피적으로 해석 가능한 구조를 가지고 있음
- 유형론에 기반하여 증명보조기로의 이식이 매우 용이함
- 요약하자면, HoTT는 컴퓨터로의 이식이 용이한, 호모토피 이론을 공리적으로 탐구할 수 있는 새로운 형식체계이다.
- Voevodsky's essay

# Basic terminologies and structural rules

- 4 kinds of judgements:

$$\Gamma \vdash A \text{ type} \quad \Gamma \vdash A \equiv A' \quad \Gamma \vdash a : A \quad \Gamma \vdash a \equiv a' : A$$

- $\Gamma$  is a **context**, a finite tuple of the forms  $(x_i : A_i)_{i < n}$ , where  $(x_i)$  are distinctive free variables, with an additional sequence of  $(n - 1)$ -judgements which is that for each  $i < n$ ,  $(x_j : A_j)_{j < i} \vdash A_i \text{ type}$ .

# Basic terminologies and structural rules

- Structural rules - Judgemental equality:

$$\begin{array}{c}
 \frac{\Gamma \vdash A \text{ type}}{\Gamma \vdash A \equiv A \text{ type}} \quad \frac{\Gamma \vdash A \equiv B \text{ type}}{\Gamma \vdash B \equiv A \text{ type}} \quad \frac{\Gamma \vdash A \equiv B \text{ type} \quad \Gamma \vdash B \equiv C \text{ type}}{\Gamma \vdash A \equiv C \text{ type}} \\
 \\
 \frac{\Gamma \vdash a : A}{\Gamma \vdash a \equiv a : A} \quad \frac{\Gamma \vdash a \equiv b : A}{\Gamma \vdash b \equiv a : A} \quad \frac{\Gamma \vdash a \equiv b : A \quad \Gamma \vdash b \equiv c : A}{\Gamma \vdash a \equiv c : A} \\
 \\
 \frac{\Gamma \vdash A \equiv B \text{ type} \quad \Gamma, x : A, \Delta \vdash \mathcal{J}}{\Gamma, x : B, \Delta \vdash \mathcal{J}}
 \end{array}$$

- Structural rules - Variable, weakening, and substitution rules:

$$\begin{array}{c}
 \frac{\vdash \Gamma, x : A, \Delta_{\text{ctxt}}}{\Gamma, x : A, \Delta \vdash x : A} \text{V} \quad \frac{\Gamma \vdash A \text{ type} \quad \Gamma, \Delta \vdash \mathcal{J}}{\Gamma, x : A, \Delta \vdash \mathcal{J}} \text{W} \quad \frac{\Gamma \vdash a : A \quad \Gamma, x : A, \Delta \vdash \mathcal{J}}{\Gamma, \Delta[a/x] \vdash \mathcal{J}[a/x]} \text{S} \\
 \\
 \frac{\Gamma \vdash a \equiv a' : A \quad \Gamma, x : A, \Delta \vdash B \text{ type}}{\Gamma, \Delta[a/x] \vdash B[a/x] \equiv B[a'/x] \text{ type}} \text{S-cong-type} \\
 \\
 \frac{\Gamma \vdash a \equiv a' : A \quad \Gamma, x : A, \Delta \vdash b : B}{\Gamma, \Delta[a/x] \vdash b[a/x] \equiv b[a'/x] : B[a/x]} \text{S-cong-term}
 \end{array}$$

# Type constructors - $\Pi$

$$\frac{\Gamma, x : A \vdash B(x) \text{ type}}{\Gamma \vdash \Pi_{x:A} B(x) \text{ type}} \Pi\text{-form} \quad \frac{\Gamma, x : A \vdash B(x) \text{ type} \quad \Gamma, x : A \vdash b(x) : B(x)}{\Gamma \vdash \lambda x. b(x) : \Pi_{x:A} B(x)} \Pi\text{-intro}$$

$$\frac{\Gamma \vdash f : \Pi_{x:A} B(x) \quad \Gamma \vdash a : A}{\Gamma \vdash f(a) : B(a)} \Pi\text{-elim}$$

$$\frac{\Gamma, x : A \vdash B(x) \text{ type} \quad \Gamma, x : A \vdash b(x) : B(x) \quad \Gamma \vdash a : A}{\Gamma \vdash (\lambda x : A. b(x))(a) \equiv b(a) : B(a)} \Pi\text{-comp-}\beta$$

$$\frac{\Gamma \vdash f : \Pi_{x:A} B(x)}{\Gamma \vdash \lambda x. f(x) \equiv f : \Pi_{x:A} B(x)} \Pi\text{-comp-}\eta$$

For the special case when  $B$  is non-dependent over  $A$ , that is, if we have two judgements  $\Gamma \vdash A \text{ type}$  and  $\Gamma \vdash B \text{ type}$ , we write  $A \rightarrow B$  for  $\Pi_{x:A} B(x)$ .

In Agda, a dependent product type  $\Pi_{x:A} \mathcal{P}(x)$  is represented as  $(x : A) \rightarrow \mathcal{P} \ x$ .

# Type constructors - $\Sigma$

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma, x : A \vdash B(x) \text{ type}}{\Gamma \vdash \Sigma_{x:A} B(x) \text{ type}} \quad \Sigma\text{-form}$$

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma, x : A \vdash B(x) \text{ type}}{\Gamma, x : A, y : B(x) \vdash \text{pair}(x, y) : \Sigma_{x:A} B(x)} \quad \Sigma\text{-intro}$$

$$\frac{\Gamma, z : \Sigma_{x:A} B(x) \vdash \mathcal{P}(z) \text{ type} \quad \Gamma, x : A, y : B(x) \vdash f(x, y) : \mathcal{P}(\text{pair}(x, y))}{\Gamma, z : \Sigma_{x:A} B(x) \vdash \Sigma\text{elim}(f, z) : \mathcal{P}(z)} \quad \Sigma\text{-elim}$$

$$\frac{\Gamma, z : \Sigma_{x:A} B(x) \vdash \mathcal{P}(z) \text{ type} \quad \Gamma, x : A, y : B(x) \vdash f(x, y) : \mathcal{P}(\text{pair}(x, y))}{\Gamma, x : A, y : B(x) \vdash \Sigma\text{elim}(f, \text{pair}(x, y)) \equiv f(x, y) : \mathcal{P}(\text{pair}(x, y))} \quad \Sigma\text{-cor}$$

For the case where  $B$  is not dependent over  $A$ , we write  $A \times B$  for  $\Sigma_{x:A} B(x)$ .

# Type constructors - +

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma \vdash B \text{ type}}{\Gamma \vdash A + B \text{ type}} \text{+-form}$$

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma \vdash B \text{ type}}{\Gamma, x : A \vdash \text{inl}(x) : A + B} \text{+-intro-l}$$

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma \vdash B \text{ type}}{\Gamma, y : B \vdash \text{inr}(y) : A + B} \text{+-intro-r}$$

$$\frac{\Gamma, z : A + B \vdash \mathcal{P}(z) \text{ type} \quad \Gamma, x : A \vdash l(x) : \mathcal{P}(\text{inl}(x)) \quad \Gamma, y : B \vdash r(y) : \mathcal{P}(\text{inr}(y))}{\Gamma, z : A + B \vdash \text{+elim}(l, r, z) : \mathcal{P}(z)} \text{+-elim}$$

$$\frac{\Gamma, z : A + B \vdash \mathcal{P}(z) \text{ type} \quad \Gamma, x : A \vdash l(x) : \mathcal{P}(\text{inl}(x)) \quad \Gamma, y : B \vdash r(y) : \mathcal{P}(\text{inr}(y))}{\Gamma, x : A \vdash \text{+elim}(l, r, \text{inl}(x)) \equiv l(x) : \mathcal{P}(\text{inl}(x))} \text{+-com}$$

$$\frac{\Gamma, z : A + B \vdash \mathcal{P}(z) \text{ type} \quad \Gamma, x : A \vdash l(x) : \mathcal{P}(\text{inl}(x)) \quad \Gamma, y : B \vdash r(y) : \mathcal{P}(\text{inr}(y))}{\Gamma, y : B \vdash \text{+elim}(l, r, \text{inr}(y)) \equiv r(y) : \mathcal{P}(\text{inr}(y))} \text{+-com}$$

# Type constructors - $\emptyset$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash \emptyset \text{ type}} \text{ } \emptyset\text{-form}$$

$$\frac{\Gamma, x : \emptyset \vdash \mathcal{P}(x) \text{ type}}{\Gamma, x : \emptyset \vdash \emptyset\text{elim}(x) : \mathcal{P}(x)} \text{ } \emptyset\text{-elim}$$

We define the negation  $\neg$  of types:

$$\neg\_ : \text{type } \ell \rightarrow \text{type } \ell$$
$$\neg X = X \rightarrow \emptyset$$

We call a type theory with the above empty type rules **inconsistent** if it is possible to construct a term in  $\emptyset$  from the empty context (i.e. it is a useless system). If not, we call the theory **consistent**.

# Type constructors - $\mathbb{1}$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash \mathbb{1} \text{ type}} \mathbb{1}\text{-form}$$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash \star : \mathbb{1}} \mathbb{1}\text{-intro}$$

$$\frac{\Gamma, x : \mathbb{1} \vdash \mathcal{P}(x) \text{ type} \quad \Gamma \vdash c : \mathcal{P}(\star)}{\Gamma, x : \mathbb{1} \vdash \mathbb{1}\text{elim}(c, x) : \mathcal{P}(x)} \mathbb{1}\text{-elim}$$

$$\frac{\Gamma, x : \mathbb{1} \vdash \mathcal{P}(x) \text{ type} \quad \Gamma \vdash c : \mathcal{P}(\star)}{\Gamma, x : \mathbb{1} \vdash \mathbb{1}\text{elim}(c, \star) \equiv c : \mathcal{P}(x)} \mathbb{1}\text{-comp}$$

# Type constructors - Inductive type $\mathbb{N}$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash \mathbb{N} \text{ type}} \text{ } \mathbb{N}\text{-form}$$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash 0 : \mathbb{N}} \text{ } \mathbb{N}\text{-intro-0}$$

$$\frac{\vdash \Gamma \text{ ctxt}}{\Gamma \vdash \text{suc} : \mathbb{N} \rightarrow \mathbb{N}} \text{ } \mathbb{N}\text{-intro-suc}$$

$$\frac{\Gamma, n : \mathbb{N} \vdash \mathcal{P}(n) \text{ type} \quad \Gamma \vdash c_0 : \mathcal{P}(0) \quad \Gamma, n : \mathbb{N} \vdash c_s : \mathcal{P}(n) \rightarrow \mathcal{P}(\text{suc}(n))}{\Gamma, n : \mathbb{N} \vdash \text{Nelim}(c_0, c_s, n) : \mathcal{P}(n)} \text{ } \mathbb{N}\text{-elim}$$

$$\frac{\Gamma, n : \mathbb{N} \vdash \mathcal{P}(n) \text{ type} \quad \Gamma \vdash c_0 : \mathcal{P}(0) \quad \Gamma, n : \mathbb{N} \vdash c_s : \mathcal{P}(n) \rightarrow \mathcal{P}(\text{suc}(n))}{\Gamma \vdash \text{Nelim}(c_0, c_s, 0) \equiv c_0 : \mathcal{P}(0)} \text{ } \mathbb{N}\text{-comp-0}$$

$$\frac{\Gamma, n : \mathbb{N} \vdash \mathcal{P}(n) \text{ type} \quad \Gamma \vdash c_0 : \mathcal{P}(0) \quad \Gamma, n : \mathbb{N} \vdash c_s : \mathcal{P}(n) \rightarrow \mathcal{P}(\text{suc}(n))}{\Gamma, n : \mathbb{N} \vdash \text{Nelim}(c_0, c_s, \text{suc}(n)) \equiv c_s(n, \text{Nelim}(c_0, c_s, n)) : \mathcal{P}(\text{suc}(n))} \text{ } \mathbb{N}\text{-comp-suc}$$

# Type constructors - Identity types $\_ = \_$

$$\frac{\Gamma \vdash A \text{ type}}{\Gamma, x, y : A \vdash x =_A y \text{ type}} =\text{-form}$$

$$\frac{\Gamma \vdash A \text{ type}}{\Gamma, x : A \vdash \text{refl}_A(x) : x =_A x} =\text{-intro}$$

$$\frac{\Gamma, x, y : A, p : x =_A y \vdash \mathcal{P}(x, y, p) \text{ type} \quad \Gamma, x : A \vdash c(x) : \mathcal{P}(x, x, \text{refl}_A(x))}{\Gamma, x, y : A, p : x =_A y \vdash =\text{elim}(c, x, y, p) : \mathcal{P}(x, y, p)} =\text{-elim}$$

$$\frac{\Gamma, x, y : A, p : x =_A y \vdash \mathcal{P}(x, y, p) \text{ type} \quad \Gamma, x : A \vdash c(x) : \mathcal{P}(x, x, \text{refl}_A(x))}{\Gamma, x, y : A, p : x =_A y \vdash =\text{elim}(c, x, x, \text{refl}_A(x)) \equiv c(x) : \mathcal{P}(x, x, \text{refl}_A(x))} =\text{-comp}$$

# Groupoid structure of types

$\_ \bullet \_ : \{X : \text{type } \ell\} \{x \ y \ z : X\} \rightarrow x = y \rightarrow y = z \rightarrow x = z$

# Conclusion

Identity types can be interpreted as path spaces and related inference rules are strong enough to construct various tools for the homotopy theory. By the univalence axiom and higher inductive types, we could introduce objects with interesting higher structures and give them fibrations to analyze them.

Recall the fact that the slight modification of the univalence axiom (namely, postulate  $\text{equiv} (= - \cong)$  instead of  $\text{equiv} (= - \simeq)$ ) makes our system inconsistent. By finding a model of HoTT in 'classical mathematics' we can bring the authority and belief in the consistency of mathematics to our theory.

# The End
